

# BodyHoist

*easy and respectful*

Up to now there was no good solution to pick up a corpse, lift it up, gently move it from it's place and lower it in the coffin. Our technical team thought of a solution and came up with a revolutionary device, named The BodyHoist\*.

The BodyHoist not only makes it very easy to place a corpse into a coffin, it also gets hold of a body even when it is already in a coffin and has to be taken out. Using the body hoist is not only very easy, also very respectful. It takes only one person where normally two or more were required.

\* Patent pending

## Specifications

- MAXIMUM ADJUSTMENT SHOULDER WIDTH:** 600 mm
- MAXIMUM ADJUSTMENT ANKLE WIDTH:** 350 mm
- MAXIMUM HOIST WEIGHT:** 260 kg\*
- ADJUSTABLE BALANCE POINT**

\* In combination with the PLS AR 260 Hoist unit.

# BodyHoist

Adjustable shoulder width

Adjustable balance point

## A revolution in body transfers

Easy to operate by only one person

Hidden tool

Easy release handle

# BodyHoist

### 1. Picking up

When in open position, the fingers of the BodyHoist gently glide along the body and follow the horizontal surface where the body is placed on.

### 2. Easy and secure

Once the fingers are in the horizontal position they automatically lock and hold the body like a big hand.

### 3. Gentle transfer

Holding the body like this makes it possible to transfer the body using a ceiling hoist system or mobile hoist.

### 4. Positioning

After positioning the body, it can be lowered into the coffin. Once fully lowered, the fingers can be released and the body stays exactly in place when the hoist raises.

### 5. Vice versa

The solution with the so called 'fingers' makes it possible to take a body out of a coffin as easy as putting it in.
